

# METHOD AND APPARATUS FOR UPDATING WEB CERTIFICATES

## Abstract Of The Disclosure

5 A method and system for updating data, such as web certificates, software applications, or other data, detects a need to update data based on a communication between a first processing entity, such as a computer with a web browser, and another processing entity, such as a web server. The web server detects the need to update data and automatically redirects communication from the first processing entity and the  
10 second processing entity, so that the first processing entity communicates with a third processing entity. The third processing entity provides updated data, such as a new version of a web browser or other software application, and also provides update complete data indicating that the software, web browser or other data has been updated. The update complete data is provided for the second processing entity so that the second processing entity will suitably perform the process requested by the first processing  
15 entity.
